pinprompt

How to use it

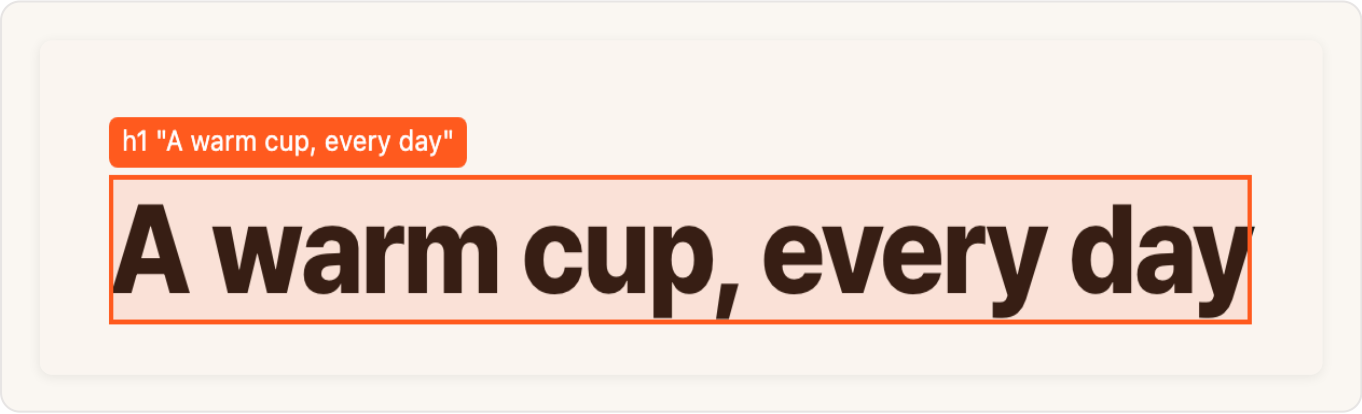

Point at what should change, leave a note, collect them, and hand them to your coding agent in one go.

1 Find the launcher, bottom-left

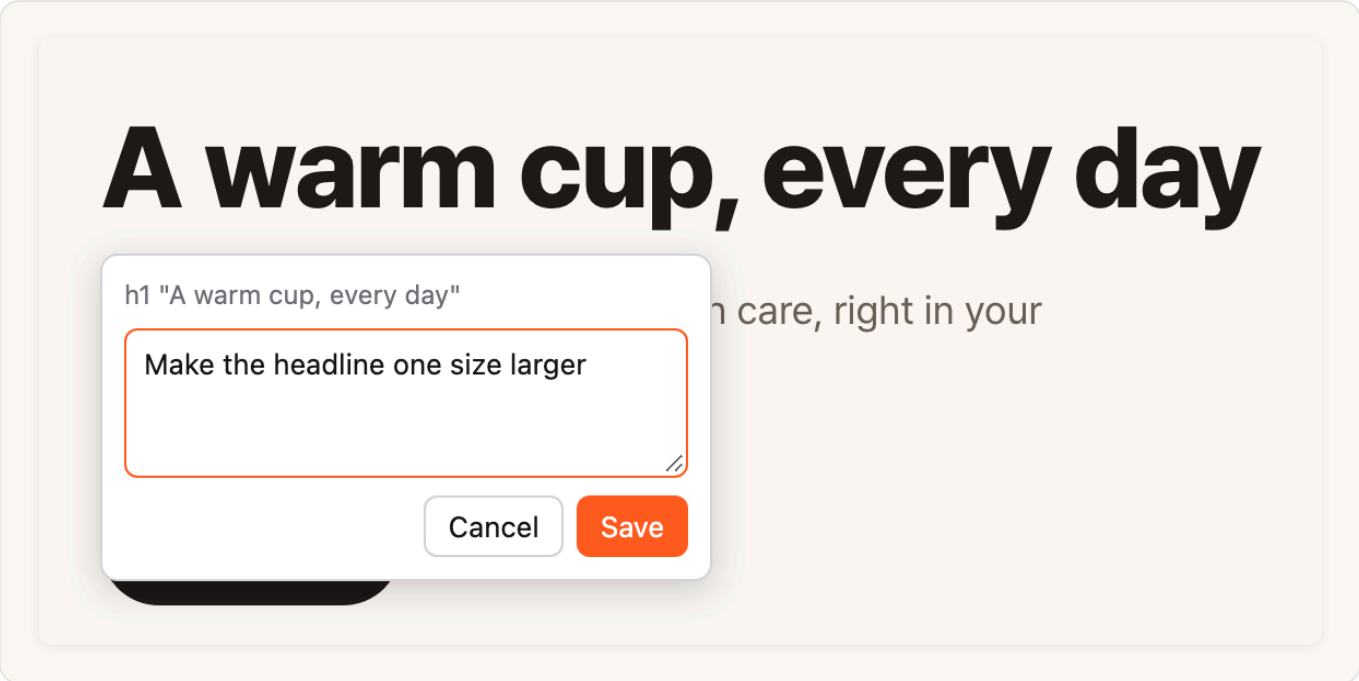

It sits in the bottom-left corner of your app in dev mode. **Notes N** shows your notes, **+** adds one, **Copy** copies them all.

2 Click + and hover what you want to change

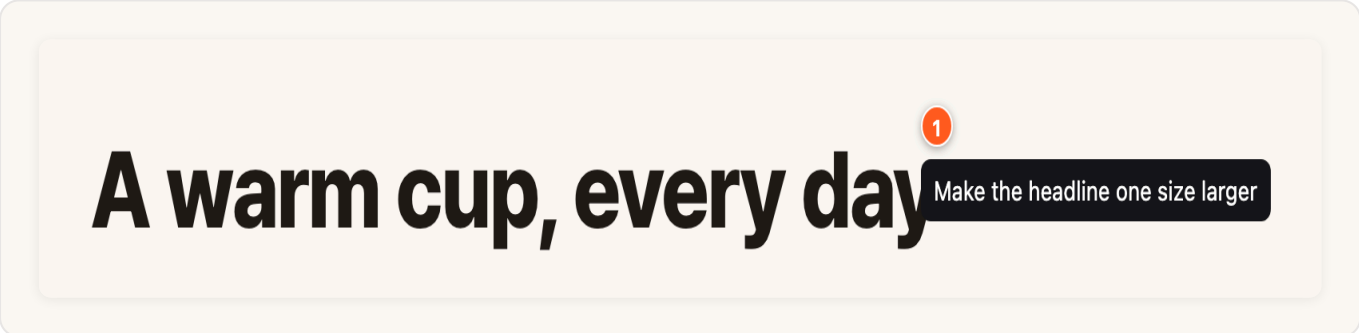

An orange box follows the pointer. While picking, clicks don't trigger your app's links or buttons.

3 Click it, type a note, press Enter

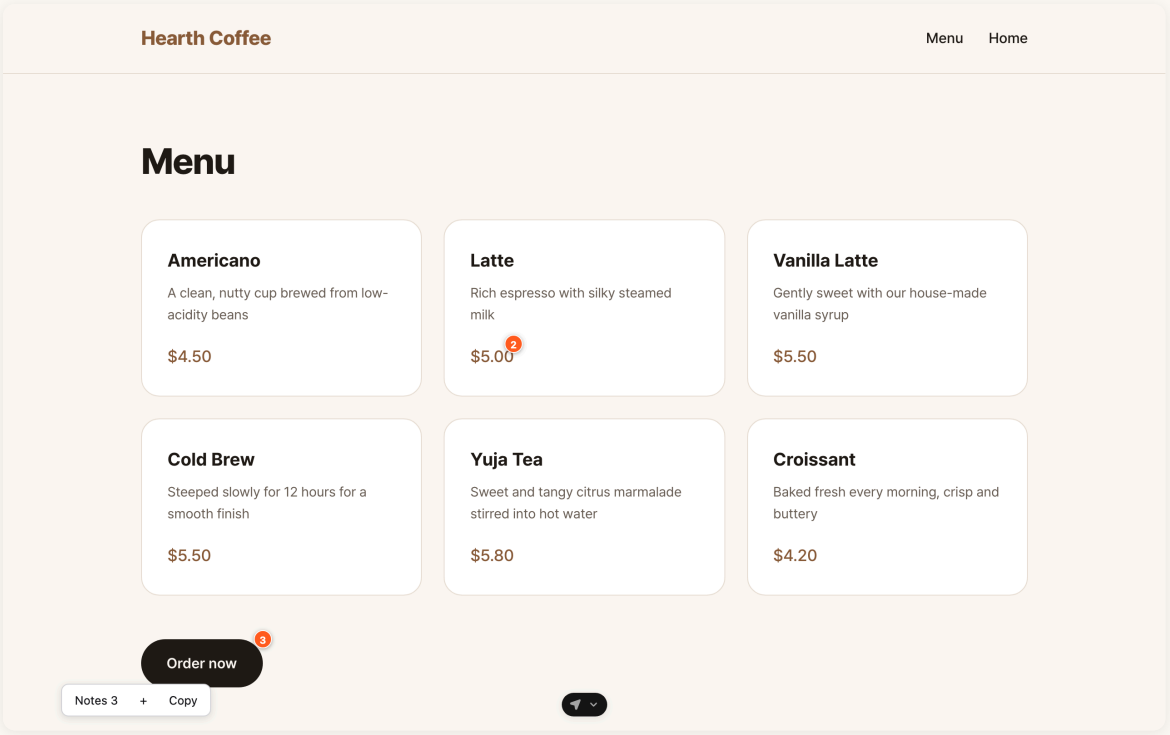

Shift + Enter adds a line, Esc cancels.

4 A numbered pin stays on the element

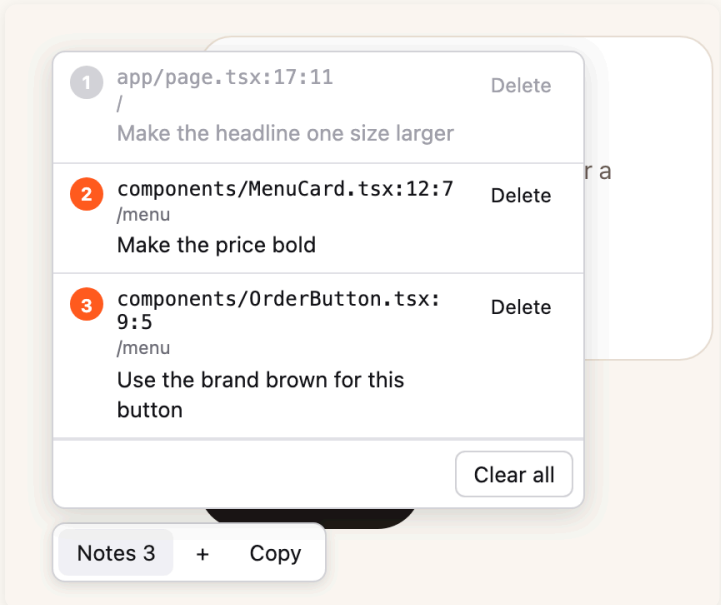

Hover the pin to preview the note. Click it to edit or delete.

5 Keep going on other pages

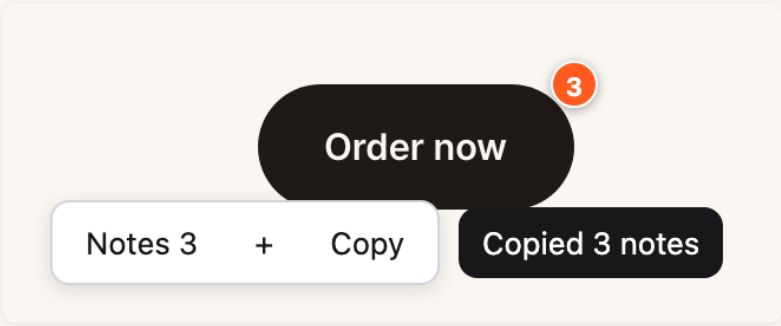

Notes survive navigation and reloads, and numbering continues. Pins only show on the page where you left them.

6 Review everything with Notes N

Notes from other pages are greyed out. Delete the ones you no longer need here.

7 Click `Copy`

Every note goes to the clipboard at once, each with its source location.

8 Paste it into your coding agent

What lands on the clipboard

```
1. app/page.tsx:17:11 (h1 "A warm cup, every day") — Make the headline one size larger
2. components/MenuCard.tsx:12:7 (strong "$5.00") — Make the price bold
3. components/OrderButton.tsx:9:5 (button "Order now") — Use the brand brown for this button
```

One note per line. The number matches the pin on screen, and `file:line:column` is the code that renders the element.
